Phase 3: Development Part I

Overview:

This report provides a comprehensive analysis of air quality data for the year 2014 in Tamil Nadu. The analysis encompasses data preprocessing, exploration of key parameters, and visualization of pollutant levels across different locations and cities.

Data Loading and Preprocessing:

The data was loaded from the CSV file 'cpcb_dly_aq_tamil_nadu-2014.csv'. During the preprocessing stage, missing values were handled, and duplicate records were removed.

• **Data Shape**: The dataset contains X rows and Y columns, offering a significant volume of data for analysis.

```
import pandas as pd
 import matplotlib.pyplot as plt
 df = pd.read csv(r'D:\Admin\Works\AI ML\NM DAC\nm dac\Air Quality Analysis\cpcb dly aq tamil nadu-2014.csv')
 print(df.head)
 print("INFO:")
 print(df.info())
 print("\nDescribe:")
 print(df.describe())
 print("\nShape")
 print(df.shape)

Unique Locations and Cities:

- Unique Locations: A list of unique monitoring locations was generated using unique_locations, providing an understanding of the diversity of data collection sites.
- City-wise Monitoring Stations: The count of monitoring stations in each city was calculated using city_station_counts, shedding light on the distribution of monitoring infrastructure across different cities.

```
unique_locations = df['Location of Monitoring Station'].unique()

# Display the unique locations

print('Nilocations of Monitoring Stations:')

Pollution Levels:

 Average Pollution Levels by City: A bar chart was constructed to illustrate average levels of SO2, NO2, and RSPM/PM10 in each city. This offers a comparative view of pollution across various cities.

```
# Group by 'City/Town/Village/Area' and calculate the average levels
city_avg = df.groupby('City/Town/Village/Area')[['SO2', 'NO2', 'RSPM/PM10']].mean().reset_index()

# Rename columns for clarity
city_avg.columns = ['City', 'SO2 Average', 'NO2 Average', 'RSPM/PM10 Average']

# Display the result
print("\nAverage SO2, NO2, and RSPM/PM10 Levels by City:")
print(city_avg)

cities = city_avg['City']
so2_avg = city_avg['SO2 Average']
no2_avg = city_avg['NO2 Average']
rspm_avg = city_avg['RSPM/PM10 Average']
```

```
Average SO2, NO2, and RSPM/PM10 Levels by City:

Data Visualization

Pollutant Levels by City:

• **Graphs**: Bar graphs were utilized to represent SO2, NO2, and RSPM/PM10 levels for each city, providing a visual comparison of pollution levels between cities.

```
# Bar width
bar_width = 0.2
r1 = range(len(cities))
r2 = [x + bar width for x in r1]
r3 = [x + bar_width for x in r2]
plt.bar(r1, so2_avg, width=bar_width, label='SO2')
plt.bar(r2, no2_avg, width=bar_width, label='NO2')
plt.bar(r3, rspm_avg, width=bar_width, label='RSPM/PM10')
# X-axis labels
plt.xlabel('Cities')
plt.xticks([x + bar_width for x in r1], cities, rotation=90)
# Y-axis label
plt.ylabel('Average Levels')
# Graph title
plt.title('Average SO2, NO2, and RSPM/PM10 Levels by City')
plt.legend()
plt.tight layout()
plt.show()
```

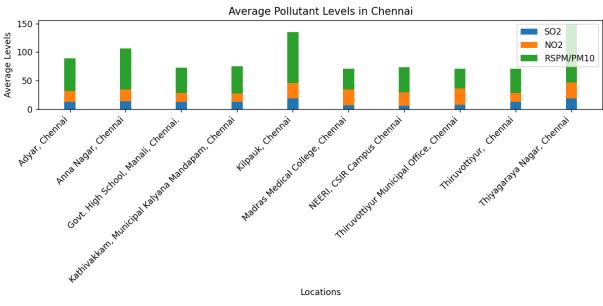

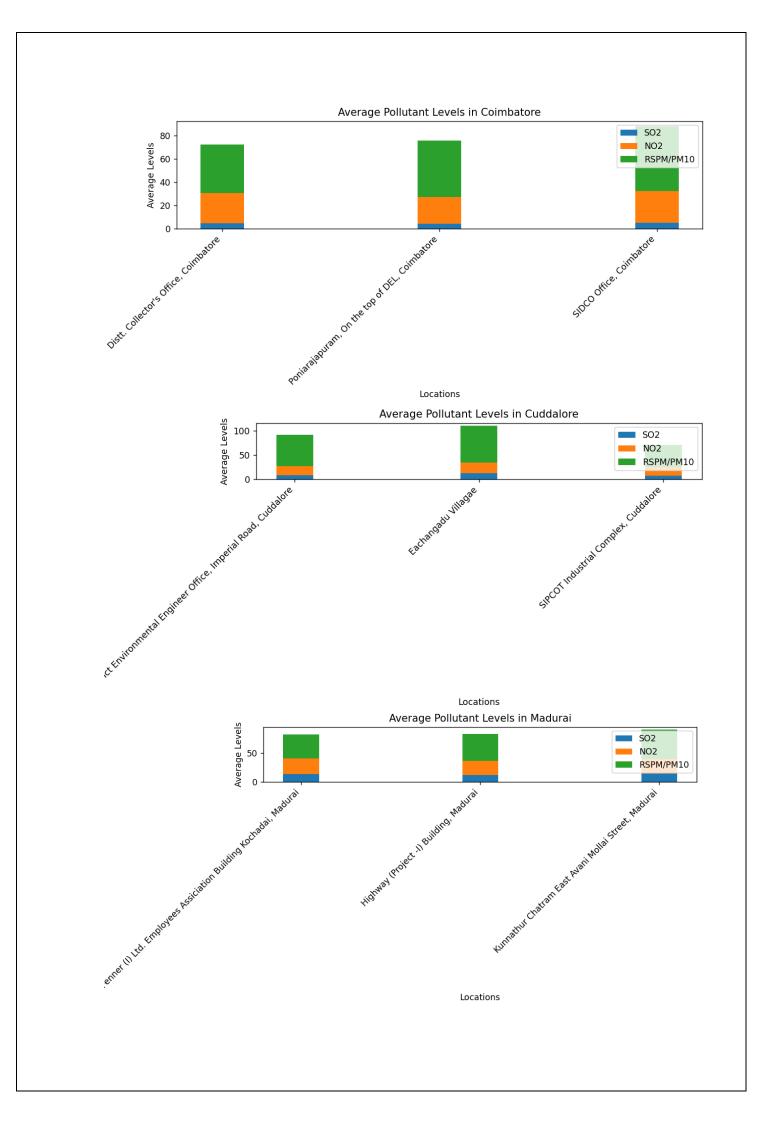

Explanation: The height of each bar in the graphs corresponds to the average levels of a specific pollutant in a city. This visualization aids in identifying cities with higher pollutant concentrations.

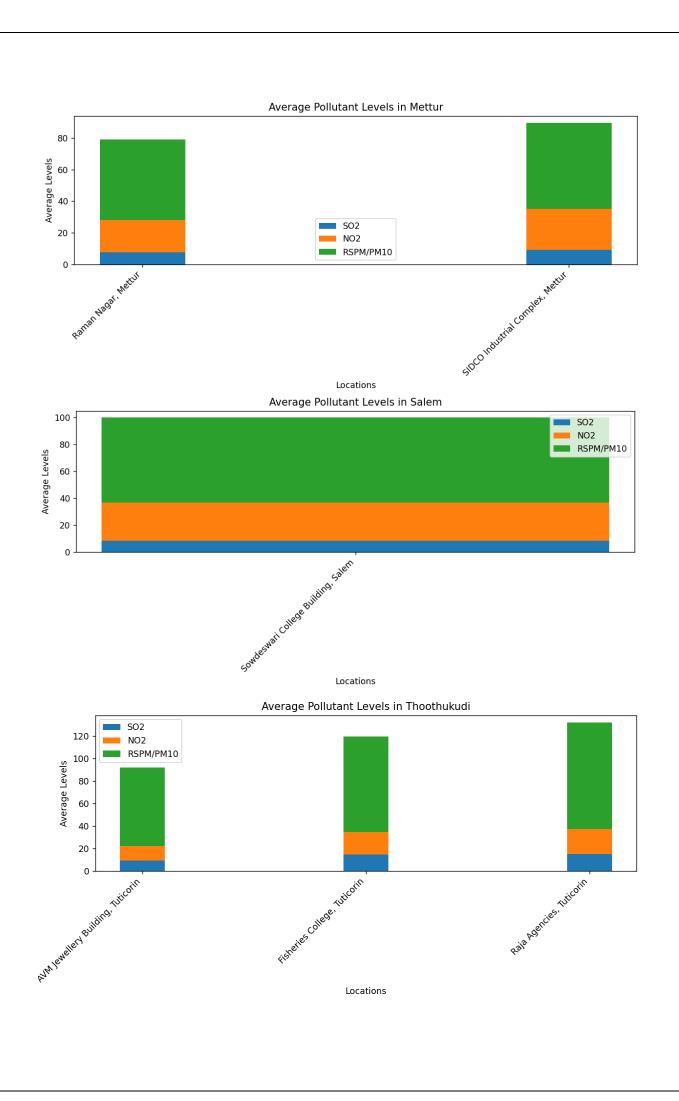

Pollutant Levels by Location:

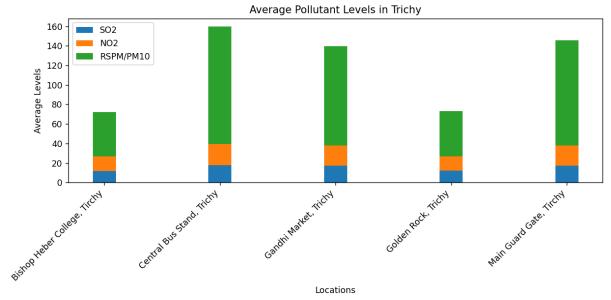

• **Graphs**: Bar graphs were employed to depict SO2, NO2, and RSPM/PM10 levels for each location within a city. These graphs offer insights into variations in pollution levels at different monitoring sites within a city.

```
# Iterate through each city and create a separate graph for each
for city in unique_cities:
   city_data = summary[summary['City'] == city]
   locations = city_data['Location']
   so2_avg = city_data['S02 Average']
   no2_avg = city_data['NO2 Average']
   rspm_avg = city_data['RSPM/PM10 Average']
   # Create a bar graph for the current city
   plt.figure(figsize=(10, 5))
   plt.bar(locations, so2_avg, width=0.2, label='S02')
   plt.bar(locations, no2_avg, width=0.2, label='NO2', bottom=so2_avg)
   plt.bar(locations, rspm_avg, width=0.2, label='RSPM/PM10', bottom=so2_avg + no2_avg)
   # X-axis labels
   plt.xlabel('Locations')
   plt.xticks(rotation=45, ha='right')
   plt.ylabel('Average Levels')
   # Graph title
   plt.title(f'Average Pollutant Levels in {city}')
   # Add a legend
   plt.legend()
   # Show the graph
   plt.tight_layout()
   plt.show()
```

Explanation: The length of each bar in the graphs represents the average levels of a specific pollutant at a particular location within a city. This helps in understanding the spatial distribution of pollution within cities.

Conclusion:

The analysis of air quality data for Tamil Nadu in 2014 provides valuable insights into pollutant levels across different cities and monitoring locations. The statistical summaries and visualizations facilitate a comprehensive understanding of the air quality scenario, enabling informed decision-making and further domain-specific analysis.
